Installation of Stop-Start Panel (B-76426A9) When Used on the D.D.I.S. Ignition

Because of the different wiring configurations between the D.D.I.S. Ignition and the Conventional Ignition Systems the above mention kit must be wired as shown (Figure I) when being used on the D.D.I.S. System.

A separate 16 gauge wire (not supplied) must be attached outside the wire harness from the stop button back to the shift plate cut out switch on the engine.

Connecting the kit using the Conventional Ignition procedure will not allow the D.D.I.S. Ignition engine to stop.
